

DASS Assignment 3 — Institute Management System (IMS)

Brief Jetpack Compose Android prototype for the IMS system required for the DASS Assignment 3.

Overview

- Purpose: A prototype Android app implementing the Dashboard and selected IMS modules (end-to-end flows simulated with a local stub repository).
- Tech: Kotlin, Jetpack Compose, Gradle (wrapper), single-activity architecture.

Project layout (key items)

- **Task1/** — design reports and UML artifacts.
- **Task2/** — UI/UX prototypes and Figma notes.
- **Task3/dass_a3/app/** — Android app implementation (main codebase).
- Main app entry points:
 - `app/src/main/java/com/atelier/ims/MainActivity.kt`
 - `app/src/main/java/com/atelier/ims/ImsViewModel.kt`
 - `app/src/main/java/com/atelier/ims/data/StubRepository.kt`

Requirements

- Android Studio (recommended) or command-line Gradle via the included wrapper.
- Android SDK and an emulator or device.

Build & run

Windows (PowerShell) using the included Gradle wrapper:

```
.\gradlew.bat assembleDebug
.\gradlew.bat installDebug
```

Or open the project in Android Studio and run the **app** module.

If you prefer a single command that builds and installs to a running emulator:

```
.\gradlew.bat installDebug
```

Important: APP_IDENTIFIER BuildConfigField

The assignment requires a **BuildConfigField** named **APP_IDENTIFIER** (String) to be set in your **app** module. Add or update inside the **defaultConfig** block of **app/build.gradle.kts** (or the Groovy

equivalent) as follows, replacing the value with your roll number format requested by the course:

```
android {
    defaultConfig {
        // example - replace with your value: "rollnumber.teamnumber"
        buildConfigField("String", "APP_IDENTIFIER",
            "\"your_rollnumber.teamnumber\"")
    }
}
```

Set the exact value requested by the assignment (e.g. "123456.0" or "rollnumber.teammates_rollnumber").

Notes for developers

- The app uses a stubbed repository ([StubRepository](#)) to simulate data flows — no server required.
- UI is implemented with Compose under [app/src/main/java/com/atelier/ims/ui/](#).
- Navigation and routes are in [navigation](#) package.

How to contribute / modify

- This repository is an assignment submission. For local changes, open in Android Studio and edit code in [app/src/main/java/com/atelier/ims](#).

Troubleshooting

- If builds fail, ensure Android SDK and build tools are installed and that the Gradle wrapper is executable.
- For emulator/device installs, make sure a device is connected or an emulator is running.

License & notes

- This repository is for the DASS Assignment 3 submission. Contact the project owner for permission before reuse.

If you want, I can add screenshots, badges, or expand sections (detailed file map, run examples). What would you like next?
